

Instructions for setting up GitHub repository and updating it with changes

=====

- go to <https://github.com/>
- create an account with your username and a password
- cd into your ast4762 folder, for me this is:

```
cd /Users/cc/Documents/university/AST4762
```

- initialize a local git repository for this folder

```
git init -b master
```

- add all of the files from your folder into the local repository
- create your initial commit

```
git add .  
git commit -m "Initial commit"
```

- create an empty repository on github website
- navigate to the website
- find the '+' button in the upper right
 - create new --> new repository
- make the repository name the exact name of your class folder
- don't change anything besides the repository name and description
- create repository

- connect your locally named repository to the remote repository we just made using command line. For my username cameroncollyer, the two lines of code, each starting with 'git' look like:

```
git remote add origin https://github.com/cameroncollyer/  
AST4762.git  
git push -u origin master
```

- it will ask for your username and password
- use your typical username
- for the password, we need to setup an access token
- go back to the github website
- go to the profile icon in the top-right corner, click settings
- scroll down to developer settings
- go to personal access tokens --> tokens (classic) --> generate

new token (classic)

- check the box for repo
- add token description and an expiration date, something in January works as this is the end of class
- generate token at bottom
- ** on the next page, copy the token to somewhere safe, you wont be able to see it again
- copy this password and paste it to your terminal command line for your password
- enter this, and it should run without any errors

• check that your files have uploaded. go to the github website and to your repository for AST4762. Under the header 'username Initial commit' it should show the folders in your AST4762 directory.

• for the future, lets say you're editing your next homework and want to push this to github.

```
git add .  
git commit -m "a note on what you did"  
git push origin master
```

- now your updates are pushed to the website repository.
